Project Title	Cricket Player Performance Tracking Application : CRICKSTATS
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The CRICKSTATS project is a Salesforce-based cricket player performance tracking application designed to manage and analyze player performance on a match-by-match basis. It addresses the difficulties of manual record keeping, scattered data, data-entry errors, and delayed performance analysis. The system provides centralized player and match performance data, automated data management, reports, and interactive dashboards to support coaches, team managers, analysts, and administrators.

Project Overview	
Objective	The primary objective of CRICKSTATS is to create a centralized Salesforce application for recording, managing, and analyzing cricket player performance. It aims to improve data accuracy, reduce manual work, and provide faster access to player statistics and performance insights.
Scope	The project covers player registration, match performance recording, player and match data management, relationships between objects, roll-up summaries, automated Salesforce Flows, reports, and dashboards. The application supports performance analysis and helps users make informed decisions based on organized player statistics.
Problem Statement	
Description	Traditional cricket performance records are often maintained manually in different files and formats. This makes it difficult to maintain accurate player records, compare performances, update statistics, and generate reports quickly. There is a need for a centralized and automated system to manage cricket performance data.
Impact	Solving these problems will reduce manual work and data errors, improve accessibility of player statistics, provide faster performance analysis, and support better team planning and player development
Proposed Solution	

Approach	CRICKSTATS uses Salesforce to create a centralized cricket performance management system. Custom Player and Match Performance objects are used to store player and match information. Relationships, roll-up summaries, Salesforce Flows, reports, and dashboards are used to automate data management and provide useful performance insights.
Key Features	• Player and Match Performance custom objects • Master-detail and lookup relationships • Roll-up summary fields for player statistics • Automated Salesforce Flows • Lightning App for easy access • Reports and interactive dashboards • Centralized player performance database • Real-time performance statistics • Secure and scalable cloud-based system

	- Real-time decision-making for quicker loan approvals. - Continuous learning to adapt to evolving financial landscapes.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU/GPU specifications, number of cores	T4 GPU
Memory	RAM specifications	8 GB
Storage	Disk space for data, models, and logs	1 TB SSD
Software		
Frameworks	Python frameworks	Flask
Libraries	Additional libraries	scikit-learn, pandas, numpy, matplotlib, seaborn
Development Environment	IDE	Jupyter Notebook, pycharm
Data		
Data	Source, size, format	Kaggle dataset, 614, csv UCI dataset, 690, csv
