Project Name	Cricket Player Performance Tracking Application: CRICKSTATS
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how your system behaves under expected and peak load conditions. Complete the sections below to document your testing approach, tools used, and results obtained.

Step 1: Testing Overview

Field	Details
Testing Tool Used	Browser Developer Tools (Chrome DevTools, Network tab) for page and flow load time; Salesforce Flow Debug for flow execution
Type of Testing	Load Testing (small-scale, manual, with multiple sample records and browser sessions)
Target Module / API	Player_Flow (team-wise player data table on the Home Page), Player and Match Performance record creation, roll-up summary and AVG Score calculation
Test Environment	Cloud: Salesforce Developer Edition org (Lightning Experience)
Test Date	[Enter the date you ran the tests]

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Open the CRICKSTATS Home Page and select a team in Player_Flow to load its players in the data table	1	30	Team players load in under 2 seconds
2	Create Match Performance records for a player and check the Player roll-up fields and AVG Score	1	60	Total Runs, Matches Played and AVG Score update instantly and correctly
3	Open Players and Match Performances list views with 100+ records	3 (parallel browser sessions)	60	List views open in under 3 seconds with no errors
4	Run the flow repeatedly for different teams (peak use during a match day)	5 (parallel browser sessions)	120	No failures, and the average response time stays under 2 seconds

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	[Enter value]	[Pass / Fail]	Measure with DevTools Network tab (Finish/Load time)
2	Response Time (Max)	< 5 seconds	[Enter value]	[Pass / Fail]	Highest load time across all scenarios
3	Throughput (Req/sec)	Not defined	[Enter value]	[N/A]	Manual UI test; note requests per second only if measured
4	Error Rate	< 1%	[Enter value]	[Pass / Fail]	Count failed page loads or flow errors
5	CPU Utilization	< 80%	N/A	N/A	Managed by Salesforce cloud; no server-level access
6	Memory Utilization	< 80%	N/A	N/A	Managed by Salesforce cloud; no server-level access

Step 4: Observations & Analysis

Key Findings:

Player_Flow returned the correct players for the selected team, and roll-up values and AVG Score were shown correctly in the data table. Enter the measured response times here after running the scenarios above. [Add measured results]

Bottlenecks Identified:

None observed at the current data size. Possible future bottlenecks: a data table with a very large number of players in one team, and roll-up recalculation when a player has many Match Performance records.

Optimization Steps Taken:

Get Records in the flow is filtered by Team so only the required players are loaded; the data table shows only the 9 needed columns; statistics are calculated by roll-up summary and formula fields on the platform instead of manual calculation.

Step 5: Screenshots / Evidence

Attach screenshots of your performance testing tool results below (e.g., DevTools Network timings, Flow Debug output, report load time):
